

Cash-to-Cash Model

When money leaves, when it comes back — breakeven visible before opening night

1

CASH OUT — THE SPEND CURVE

Production spend by month (S-curve, 18–24 months) · pre-opening marketing · working capital & deposits · vendor payment milestones tied to gates, not dates.

2

CASH IN — THE REVENUE RAMP

Presales opening month –6 · OTA & tour-operator contracts · ticket ramp-up curve (conservative until proven) · phase-2 revenue (sponsorship, F&B) layered later.

3

THE CASH ENGINE

Month-by-month cumulative cash position from first contract to year 3. The curve's lowest point = peak funding need. Where it crosses zero = true breakeven. FX exposure (VND/USD) marked on every USD-denominated outflow.

4

GATE: BREAKEVEN AT OPENING

The discipline: presales + committed revenue must cover year-one operating cash before opening night. If the curve says otherwise, the opening moves or the spend does.

5

THE CEO VIEW

One chart for the board: the cash curve with peak need, breakeven date and three scenarios (base / slow ramp / strong presales). No surprises after signature.

How to read it

Spending (1) and revenue (2) each get an honest monthly curve; the engine (3) merges them into one cumulative cash line. The breakeven-at-opening gate (4) is the go/no-go test, and leadership steers with the one-chart view (5). Built on the same platform — projects and scenarios flow straight in from the Business Model.
